

## Axiomatic Semantics and Hoare-style Verification

Axiomatic semantics (or Hoare-style logic) defines the meaning of a statement in terms of its effects on assertions of truth that can be made about the associated program. A *Hoare Triple* encodes these assertions in the form  $\{P\}S\{Q\}$  where  $P$  is the precondition,  $Q$  is the postcondition, and  $S$  is a piece of code of interest. Using derivation rules for Hoare triples, we can prove that these triples hold.

1. Prove  $\{x > 1\} \ x := x+1; \ x := -x \ \{x < 0\}$ .

$$\frac{\frac{\frac{\vdash x > 1 \Rightarrow x+1 > 2}{\vdash \{x+1 > 2\} \ x := x+1 \ \{x > 2\}} \text{ assign} \quad \frac{\vdash \{x > 2\} \ x := -x \ \{-x > 2\}}{\vdash \{x > 2\} \ x := -x \ \{-x > 2\}} \text{ assign}}{\vdash \{x+1 > 2\} \ x := x+1; \ x := -x \ \{-x > 2\}} \text{ seq} \quad \frac{\vdash -x > 2 \Rightarrow x < 0}{\vdash -x > 2 \Rightarrow x < 0} \text{ consq}}{\vdash \{x > 1\} \ x := x+1; \ x := -x \ \{x < 0\}} \text{ consq}$$

2. Prove that the program  $x := x+y; \ y := x-y; \ x := x-y$  swaps the values of  $x$  and  $y$ . The conclusion should be:

$$\{x = A \wedge y = B\} \ x := x+y; \ y := x-y; \ x := x-y \ \{y = A \wedge x = B\}$$

Let R be the derivation

$$\frac{\vdash x = A \wedge y = B \Rightarrow x+y = A+B \wedge y = B \quad \frac{\vdash \{x+y = A+B \wedge y = B\} \ x := x+y \ \{x = A+B \wedge y = B\}}{\vdash \{x+y = A+B \wedge y = B\} \ x := x+y \ \{x = A+B \wedge y = B\}} \text{ assign}}{\vdash \{x = A \wedge y = B\} \ x := x+y \ \{x = A+B \wedge y = B\}} \text{ consq}$$

Let S be the derivation

$$\frac{\vdash x = A+B \wedge x-y = A \Rightarrow x = A+B \wedge x-y = A \quad \frac{\vdash \{x = A+B \wedge x-y = A\} \ y := x-y \ \{x = A+B \wedge y = A\}}{\vdash \{x = A+B \wedge x-y = A\} \ y := x-y \ \{x = A+B \wedge y = A\}} \text{ assign}}{\vdash \{x = A+B \wedge x-y = A\} \ y := x-y \ \{x = A+B \wedge y = A\}} \text{ consq}$$

Let T be the derivation

$$\frac{}{\vdash \{x-y = B \wedge y = A\} \ x := x-y \ \{y = A \wedge x = B\}} \text{ assign}$$

Let U be the derivation

$$\frac{\frac{S \quad T}{\vdash \{x = A+B \wedge x-y = A\} \ y := x-y; \ x := x-y \ \{y = A \wedge x = B\}} \text{ seq}}{\vdash \{x = A+B \wedge x-y = A\} \ y := x-y; \ x := x-y \ \{y = A \wedge x = B\}} \text{ seq}$$

Putting these together, we then have the final derivation:

$$\frac{\frac{R \quad U}{\vdash \{x = A \wedge y = B\} \ x := x+y; \ y := x-y; \ x := x-y \ \{y = A \wedge x = B\}} \text{ seq}}{\vdash \{x = A \wedge y = B\} \ x := x+y; \ y := x-y; \ x := x-y \ \{y = A \wedge x = B\}} \text{ seq}$$
